APPLICATION MACHINERY SPECIALISTS & CONTRACTORS

Metam 510

Metam 510 application is a very specialised operation and only contractors complying with the Manufacturers duty of care are approved. Operators require a PA 13 certificate ADR licence and very specific training to operate the equipment.

Metam 510 is distributed by Certis and is delivered in either IBC containers or 220 litre barrels. Farm deliveries are allowed to secure sites prior to application. We transport the IBC containers to the place of operation in a caged trailer. Empty containers are returned to our yard where they are decontaminated prior to collection by a Certis approved contactor for recycling. Our machines are equipped with RDS rate master flow controls and programmed to the required rate selected by the customer. There is no recognized certificate of calibration due to the toxicity of the chemical so we do this by running a measured amount from a IBC through the rate master into a empty IBC which records that the measured amount is recorded correctly. Our tractor is fitted with a GPS measuring device and we also carry hand held GPS to ensure and check accurate application.

Key Points.

1. Metam 510 is classified corrosive and dangerous for the environment and full protective clothing as directed on product label should be used whilst handling the product.

2. The product is used in concentrated form and not diluted so the potential for contamination is high.

3. Metam 510 is very corrosive when it mixes with moisture. Care to avoid moisture ingress into the equipment should be taken.

4 Empty IBC Containers should be returned to the supplier and not reused in any way.
